

Dr. Liang obtained her Ph.D. degree at Peking University in 2007, where she studied neuronal mechanisms underlying opioid addiction and alternative therapy, such as electric acupuncture. She got her postdoctoral training in Thomas Südhof's lab at Stanford University during 2011-2013, where she developed molecular and genetic tools for exploring brain circuits and addressing questions related to cognitive functions. Now, she works in Institute of Psychology, Chinese Academy of Sciences, as a youth distinguished professor. Dr. Liang and her team are interested in mapping neuronal circuitries underlying cognitive processes in the basic and psychopathological behaviors.
